LINDEX POWDER

Mixing Directions for Interior

Ten pounds of LINDEX Powder should be mixed with water, either warm or cold, to a heavy cream consistency. Stir thoroly to break up all lumps. Additional water should be added to bring the mixture to a brushing or spraying consistency. The finish obtained by using LINDEX, mixed with the water only, will be a washable finish, but a more washable finish can be obtained by adding one pint of boiled linseed oil to each ten pounds of LINDEX Powder. If the boiled linseed oil is to be used, prepare the LINDEX Powder in the proportions of ten pounds of powder to the necessary amount of water to bring the material to a creamy consistency. The mixture should be allowed to stand for about thirty minutes, and then one pint of boiled linseed oil added. When adding the linseed oil, stir it in thoroly until free from lumps. For best results, the mixed LINDEX should be put thru a paint strainer. A good heavy cream consistency is desirable for one-coat coverage.

AVOID MIXING TOO THIN.

Use clean metal container for mixing.

LINDEX PASTE

Mixing Directions for Interior

Gradually add water (about $\frac{1}{2}$ gal.) to each gallon of Lindex Paste. Use warm water in cold weather. Sufficient water should be added to obtain brushing or spraying consistency. Only mix enough material to use in one day. If more is mixed with water than will be used during the day, then the container should be covered with a damp cloth, and the material used the following day.

Use clean metal container for mixing.
